
Medium-density performance line ARM-based 32-bit MCU with up to 128KB Flash, up to 28KB SRAM, USB, 7 timers, 10/12-bit ADC, 11 communication interfaces.

Features

- Core: ARM 32-bit Cortex™-M3 CPU
 - 72 MHz maximum frequency, 1.25 DMIPS/MHz (Dhrystone 2.1) performance
 - 64 Byte cache for instruction and data bus support 0 wait state memory access
 - Single-cycle multiplication and hardware division
- Memories
 - 64, 96 or 128Kbytes of Flash memory
 - 20 or 28 Kbytes of SRAM
- Clock, reset and supply management
 - 2.0 to 3.6 V application supply and I/Os
 - POR, PDR, and programmable voltage detector (PVD)
 - 4-to-16 MHz crystal oscillator
 - Internal 8 MHz factory-trimmed RC
 - Internal 48 MHz factory-trimmed RC
 - Internal 32 kHz RC
 - PLL for CPU clock
 - 32 kHz oscillator for RTC with calibration
- Low power
 - Sleep, Stop and Standby modes
 - VBAT supply for RTC and backup registers
 - Run mode: 150uA/MHz
 - Stop mode: 28uA @3.3V
 - Standby mode: 4uA @3.3V
 - VBAT with RTC: 0.5uA @3.3V
- 10/12-bit mode ADC
 - Max convert rate: 1Msps
 - Up to 16 A/D channels
 - Support 4 channel sample simultaneously in 10-bit mode
 - Flexible sample and converter modes.
 - Temperature sensor
- Comparator
 - 2 independent comparators
 - Each with 4 positive and 4 negative input channels
- LED driver unit
 - Capable of drive 56 LEDs or 8 Seven-segment LEDs
- Up to 51 fast I/O ports
 - 26/37/51 I/Os, all mappable on 16 external interrupt vectors
- Debug mode
 - Serial wire debug (SWD) interface
- 7 timers
 - Three 20-bit timers, each with up to 4 IC/OC/PWM or pulse counter and quadrature (incremental) encoder input
 - 20-bit, motor control PWM timer with dead-time generation and emergency stop
 - 2 watchdog timers (Independent and Window)
 - SysTick timer: a 24-bit downcounter
- Up to 11 communication interfaces
 - 2 x I2C interfaces (SMBus/PMBus)
 - 3 UARTs (IrDA capability, modem control)
 - 3 SPI interfaces, 1 QSPI interface
 - I2S interface
 - USB 2.0 full-speed interface
- 2 DMA controller, triggered by Timers, ADC, SPIs, I2Cs, UARTs
- CRC calculation unit, 96-bit unique ID
- RNG generate Random number
- Packages are ECOPACK ®

Chapter 1

Introduction

1.1 Description

The WB32F103xx performance line family incorporates the high-performance ARM @Cortex™-M3 32 bit RISC core operating at 72 MHz maximum frequency, Memory up to 128KB FLASH, 28KB SRAM, One advanced-control timer, Three general-purpose timers, Two watchdog timers (Independent and Window), Three SPI and one QSPI interfaces, Two I2C interfaces, Three UART interfaces, One I2S interface, One USB2.0 Full Speed interface, One 12-bit SAR ADC converter, One LED driver, Two comparators, One RTC.

1.2 Features

- Supply Management
 - Main supply voltage (VDD): 2.0V - 3.6V
 - Battery supply voltage (VBAT): 1.8V - 3.6V
 - VBAT for RTC and 84 Byte backup registers
- Low Power
 - Sleep, Stop and Standby modes
 - Run mode: 105uA/MHz
 - Stop mode: 18.5uA @3.3V
 - Standby mode: 4.5uA @3.3V
 - VBAT with RTC: 1.1uA @3.3V
- Operation temperature
 - Industrial temperature range (-40°C ~ +85°C)
 - Commercial temperature range (0°C ~ 85°C)
- Reset
 - NRST reset
 - Power On reset
 - Software reset
 - Watchdog (IWDT and WWDT) reset
 - Low power mode reset
- Programmable Voltage Detector (PVD)
 - Adjustable 8 detect levels

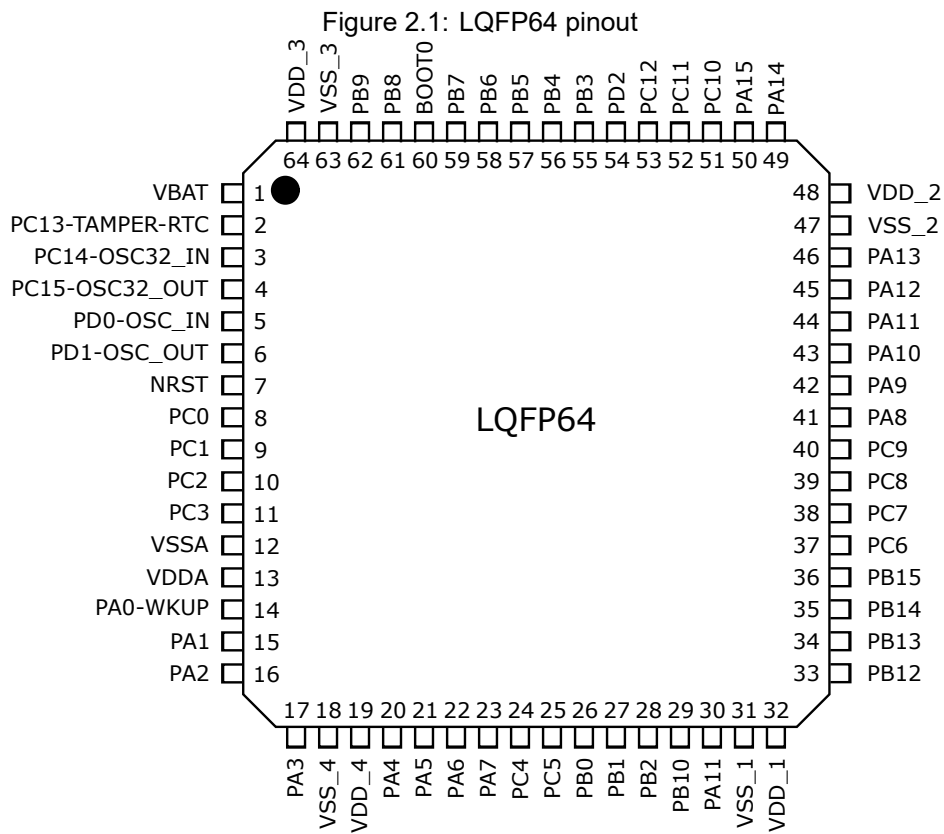

- Configurable rising/falling detect edges
- Clock
 - 4 -16 MHz crystal oscillator, typical 8MHz (HSE)
 - 32 kHz oscillator for RTC with calibration (LSE)
 - Internal 8 MHz factory-trimmed RC (MHSI)
 - Internal 48 MHz factory-trimmed RC (FHSI)
 - Internal 32 kHz RC (LSI)
 - PLL for CPU clock
- High performance 32-bit ARM CPU Core
 - Up to 72 MHz ARM Cortex™-M3 Core
 - 64 Byte cache for instruction and data bus, support 0 wait state memory access
 - Configurable system clock frequency
 - Nestable interrupt vector controller
 - Single-cycle multiplication and hardware division
 - 24-bit System Tick down-counter
- Flash
 - 64KB ~ 128KB Flash
- SRAM
 - 20KB ~ 28KB SRAM
- 12-bit SAR A/D converter
 - Up to 16 A/D input channels
 - Max convert rate: 1Msps
 - Continuous sample and converter mode.
 - Software or Hardware triggered A/D converter mode.
 - Temperature sensor connect to A/D channel 16.
- Comparator
 - 2 independent comparators
 - 4 positive and 4 negative input channels for each comparator
- Debug Port
 - Serial wire debug (SWD)
 - Cortex-M3 Instrumentation Trace Macrocell (ITM)
- Communication interfaces
 - Up to 3 UART interfaces
 - 3 SPI interfaces, 1 QSPI interface
 - 2 I2C interfaces, support SMBus 2.0/PMBus
- Timers
 - Three 20-bit timers, each with up to 4 IC/OC/PWM or pulse counter and quadrature (incremental) encoder input
 - 20-bit PWM counter
 - Trigger A/D convertor

- General purpose IOs
 - 64-pin production has 51 GPIOs, 48-pin production has 37 GPIOs, 36-pin production has 26 GPIOs, 32-pin production has 25 GPIOs
 - All GPIO mappable on 16 external interrupt vectors
 - Up to 16mA drive current
- Multichannel DMA controller, can be triggered by Timers, ADC, SPIs, I2Cs, UARTs
- CRC calculation unit, support 8/ 16/ 32 bit CRC algorithms.
- RNG Unit, generate Random number
- LED driver unit, support up to 56 LEDs or 8 Seven-segment LEDs.
- Real-time clock counter (RTC)
- Support software second development
- Support LQFP64, LQFP48, QFN36, QFN32 packages

Operating temperatures		Industrial temperature □-40°C ~ +85°C Junction temperature □-40°C ~ +125°C					
Packages		QFN32	LQFP48		LQFP64		

4.2 ARM Cortex™-M3 core

Cortex™ M3 is a 32-bit RISC processor core with three levels pipeline. It includes the AMBA-Lite interface and is tightly coupled with a Nested Vectored Interrupt Controller (NVIC), which is a low cost but high performance MCU platform. It has optional hardware debugging function, can execute Thumb-2 instruction, and is compatible with other Cortex-M series. WB32F103xx performance line family incorporates the ARM®Cortex™-M3 processor core, so it is compatible with all ARM tools and software.

4.3 Memory map

Program memory, data memory, system memory and AHB/APB peripherals are organized within the same linear 4-GB address space. The addressable memory space is divided into 8 main blocks, each of 512 MB.

AHB peripheral address space is 64KB, can support up to 64 peripherals. APB peripheral address space is 64KB, each peripheral can use up to 1KB address space. APB peripheral only support word access, byte and half-word accesses are not supported.

System memory address space is 4KB and reserved for ISP program.

The WB32F103xx memory map is organized below:

Figure 4.1: WB32F103xx memory map

4.4 System reset

System reset can be triggered by the sources below:

- POR reset (POR)
- NRST
- WDG reset (IWDG and WWDG)
- CPU Software reset
- Exiting standby mode

Any source above can trigger the system reset. When the working voltage is proper, the MHSI will be turned on and kept active. When NRST is asserted to high level, the oscillator will start running, and the flash controller will finish the device initialization.

4.5 NVIC

Cortex™-M3 is tightly coupled with the Nested Vectored Interrupt Controller (NVIC). This hardware block provides flexible interrupt management features with minimal interrupt latency.

The main feature includes:

- low latency interrupt processing
- handle the system exceptions/faults and peripheral interrupts/events
- support up to 43 maskable interrupt channels (not including the 16 interrupt lines of Cortex™-M3)
- four programmable levels for the interrupt priority
- generate the software interrupt
- configurable Non Maskable Interrupt (NMI).

4.6 EXTI

The external interrupt/event controller consists of 19 edge detector lines used to generate interrupt/event requests. Each line can be independently configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests.

4.7 Clocks and startup

System clock selection is performed on startup, however the internal RC 8 MHz oscillator is selected as default CPU clock on reset. An external 4-16 MHz clock, internal RC 48 MHz oscillator or clock output from PLL can be selected as system clock. When an external 4-16 MHz clock is used, it is monitored for failure. If failure is detected, the system automatically switches back to the internal RC 8 MHz oscillator. A software interrupt is generated if enabled.

Several prescalers allow the configuration frequency of the AHB, APB1 and APB2 domains. The maximum frequency of the AHB, APB1 and APB2 is 72 MHz, and the frequency of them can be configured independently.

4.8 Boot mode

At startup, boot pins are used to select one of three boot options:

- Boot from user Flash
- Boot from system memory
- Boot from embedded SRAM

4.9 Power supply schemes

- VDD = 2.0~3.6V: external power supply for I/Os and the internal regulator. Provided externally through VDD pins.
- VDDA = 2.4~3.6V: external analog power supplies for ADC, and the minimum voltage should be 2.4 V when the ADC is used.
- VBAT = 1.8~3.6V: power supply for RTC, external clock 32 kHz oscillator and backup registers (through power switch) when VDD is not present.

Note: VDDA must be the same potential as VDD. It is recommended to power VDD and VDDA from the same source.

4.10 DMAC

Two general-purpose DMACs, each have 3 channels and up to 16 hardware DMA requests (16 requests for DMAC0 and 12 requests for DMAC1) are able to manage memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers. The two DMA controllers have internal arbiter to arbitrate the priority of DMA requests.

Each channel can be configured with to hardware DMA requests, or also support for software trigger on each channel. Configuration is made by software and transfer sizes between source and destination are independent.

The DMA can be used with the main peripherals: SPI, I2C, UART, TIMx and ADC.

4.11 RTC (real-time clock) and backup registers

The RTC and the backup registers are supplied through a switch that takes power either on VDD supply when present or through the VBAT pin. The backup registers are forty-two 16-bit registers used to store 84 bytes of user application data when VDD power is not present. They are not reset by a system or power reset, and they are not reset when the device wakes up from the Standby mode.

4.12 Independent watchdog

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 32 kHz internal RC and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free running timer for application timeout management. It is hardware or software configurable through the option bytes. The counter can be frozen in debug mode.

4.13 Window watchdog

The window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

4.14 System Tick

This timer is dedicated to real-time operating systems, but could also be used as a standard down counter. It features:

- A 24-bit down counter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0.
- Clock source is fixed to 1/8 of CPU frequency

4.15 General-purpose timers

There are up to 3 synchronizable general-purpose timers (TIM2, TIM3 and TIM4) embedded in the WB32F103xx performance line devices. These timers are based on a 20-bit auto-reload up/down counter, a 16-bit prescaler and feature 4 independent channels each for input capture/output compare, PWM or one-pulse mode output. This gives up to 16 input captures / output compares / PWMs on the largest packages.

The general-purpose timers can work together with the advanced-control timer via the Timer Link feature for synchronization or event chaining. Their counter can be frozen in debug mode. Any of the general-purpose timers can be used to generate PWM outputs. They all have independent DMA request generation.

These timers are capable of handling quadrature (incremental) encoder signals and the digital outputs from 1 to 3 hall-effect sensors.

4.16 I2C bus

Up to two I²C bus interfaces can operate in multimaster and slave modes. They can support standard ($\leq 100\text{Kb/s}$), fast mode ($\leq 400\text{Kb/s}$) and high speed mode ($\leq 3.4\text{Mb/s}$).

They support 7/10-bit addressing mode and 7-bit dual addressing mode (as slave). A hardware CRC generation/verification is embedded.

They can be served by DMA and They support SMBus 2.0/PMBus.

4.17 Universal asynchronous receiver transmitters (UART)

Up to three universal asynchronous receiver transmitters (UART1, UART2 and UART3), These three interfaces provide asynchronous communication, IrDA SIR support. UART1, UART2 and UART3 interfaces are able to communicate at speeds of up to 6.0 Mbit/s. They also provide hardware management of the CTS and RTS signals.

All interfaces can be served by the DMA controller.

4.18 Serial peripheral interface (SPI)

Two SPIs are able to communicate up to 18 Mbits/s in slave modes in full-duplex and simplex communication modes. One SPI and one QSPI are able to communicate up to 24 Mbits/s in master modes in full-duplex and simplex communication modes. The frame can be configurable to 4bits, 8 bits, 16 bits or 32bits.

Both SPIs and QSPI can be served by the DMA controller.

4.19 GPIOs (general-purpose inputs/outputs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high current- capable except for analog inputs.

The I/Os alternate function configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

4.20 ADC

One 12-bit analog-to-digital converters is embedded into WB32F103xx performance line devices and the ADC support up to 16 external channels, performing conversions in single-shot or scan modes. In scan mode, automatic conversion is performed on a selected group of analog inputs.

The ADC can be served by the DMA controller.

An analog watchdog feature allows very precise monitoring of the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

The events generated by the general-purpose timers (TIMx) can be internally connected to the ADC start trigger and injection trigger, respectively, to allow the application to synchronize A/D conversion and timers.

VDDA supply power for ADC, range from 2.4V-3.6V, ADC convert input voltage from 0V to VDDA.

The temperature sensor is internally connected to the ADC1_IN16 input channel which is used to convert the sensor output voltage into a digital value.

4.21 Comparators

Up to 2 voltage comparators, each of them has 4 positive input channels and 4 negative input channels.

4.22 Random number generator

One Random number generator, used to generate 8/16/32 bit Random number.

4.23 LED Driver

One LED driver, support up to 56 LEDs or 8 Seven-segment LEDs.

4.24 CRC (cyclic redundancy check) calculation unit

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from an 8/16/32-bit data word and a fixed generator polynomial.

4.25 Embedded SRAM and Flash memory

Up to 256 Kbytes of embedded Flash is available for storing programs and data.

Up to 36 Kbytes of embedded SRAM accessed (read/write) at CPU clock speed with 0 wait states.

4.26 Power supply supervisor

The device has an integrated power-on reset (POR) /power-down reset (PDR) circuitry. It is always active, and ensures proper operation starting from/down to 2.0V. The device remains in reset mode when VDD is below a specified threshold, $V_{POR/PDR}$, without the need for an external reset circuit.

The device features an embedded programmable voltage detector (PVD) that monitors the VDD /VDDA power supply and compares it to the V_{PVD} threshold. An interrupt can be generated when VDD /VDDA drops below the V_{PVD} threshold and/or when VDD /VDDA is higher than the V_{PVD} threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

4.27 Low-power modes

WB32F103xx supports three low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

- **Sleep mode**

In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.

- **Stop mode**

Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the 1.2 V domain are stopped, the PLL, the MHSI RC, the FHSI RC and the HSE crystal oscillators are disabled. The voltage regulator can also be put either in normal or in low-power mode.

The device can be woken up from Stop mode by any of the EXTI line. The EXTI line source can be one of the 16 external lines, the PVD output, the RTC alarm or the USB wakeup.

- **Standby mode**

The Standby mode is used to achieve the lowest power consumption. The internal voltage regulator is switched off so that the entire 1.2 V domain is powered off. The PLL, the MHSI, the FHSI and the HSE crystal oscillators are also switched off. After entering Standby mode, SRAM and register contents are lost except for registers in the Backup domain and Standby circuitry.

The device exits Standby mode when an external reset (NRST pin), an IWDG reset, a rising edge on the WKUP pin, or an RTC alarm occurs.

Note: The RTC, the IWDG, and the corresponding clock sources are not stopped by entering Stop or Standby mode.

4.28 SWD Debug Port

The ARM SWJ-DP Interface is embedded, and is a serial wire debug port that enables a serial wire debug to be connected to the target.

Chapter 5

Electrical characteristics

5.1 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in Table 5.1: Voltage characteristics, Table 5.2: Current characteristics, and Table 5.3: Thermal characteristics may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

5.1.1 Voltage characteristics

Table 5.1: Voltage characteristics

Symbol	Ratings	Min	Max	Unit
VDD-VSS	External main supply voltage (including VDDA and VDD)	-0.5	3.6	V
V _{in}	Input voltage on pins	VSS-0.3	VDD+0.5	
ΔV_{DDx}	Variations between different VDD power pins	-	50	mV
$V_{SSx} - V_{SS}$	Variations between all the different ground pins	-	50	

5.1.2 Current characteristics

Table 5.2: Current characteristics

Symbol	Ratings	Max	Unit
I _{VDD}	Total current into VDD/VDDA power lines (source)	60	mA
I _{VSS}	Total current out of VSS ground lines (sink)	60	
I _{IO}	Output current sunk by any I/O and control pin	16	
	Output current source by any I/Os and control pin	-16	
I _{INJ(PIN)}	Injected current on any pin	± 5	
$\sum I_{INJ(PIN)}$	Total injected current	± 25	

Note1: All main power (VDD , VDDA) and ground (VSS , VSSA) pins must always be connected to the external power supply, in the permitted range.

Note2: Negative injection disturbs the analog performance of the device

Note3: A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$, $I_{INJ(PIN)}$ must never be exceeded.

Note4: When several inputs are submitted to a current injection, the maximum $\sum I_{INJ(PIN)}$ is the absolute sum of the positive and negative injected currents (instantaneous values).

5.1.3 Thermal characteristics

Table 5.3: Thermal characteristics

Symbol	Rating	Value	Unit
T_{STG}	Storage temperature range	-45 ~ +150	°C
T_J	Maximum junction temperature	100	

5.2 Operating conditions

5.2.1 General operating conditions

Table 5.4: General operating conditions

Symbol	Parameter	Min	Max	Unit
f_{HCLK}	Internal AHB clock frequency	-	72	MHz
f_{PCLK1}	Internal APB1 clock frequency	-	72	
f_{PCLK2}	Internal APB2 clock frequency	-	72	
VDD	Standard operating voltage	2	3.6	V
VDDA	Analog operating voltage	2	3.6	V
VBAT	Backup operating voltage	1.8	3.6	V
T	Ambient temperature	-40	85	°C

Note1: It is recommended to power VDD and VDDA from the same source. A maximum difference of 300 mV between VDD and VDDA can be tolerated during power-up and operation

Note2: When ADC is used, VDDA operation voltage is 2.4V~3.6V.

5.2.2 Embedded reset and power control block characteristics

Table 5.5: Power on Reset characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
T_{delay}	RSTN establish time	-	-	40	-	us
$V_{POR/PDR}$	Power on reset threshold	rising edge	-	1.92	-	V
		falling edge	-	1.88	-	V

Table 5.6: PVD characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{PVD}	Programmable voltage detector select rising edge	PLS[2:0] = 000	-	2.25	-	V
		PLS[2:0] = 001	-	2.35	-	
		PLS[2:0] = 010	-	2.45	-	
		PLS[2:0] = 011	-	2.55	-	
		PLS[2:0] = 100	-	2.65	-	
		PLS[2:0] = 101	-	2.75	-	
		PLS[2:0] = 110	-	2.85	-	
		PLS[2:0] = 111	-	2.95	-	
	Programmable voltage detector select falling edge	PLS[2:0] = 000	-	2.14	-	
		PLS[2:0] = 001	-	2.24	-	
		PLS[2:0] = 010	-	2.34	-	
		PLS[2:0] = 011	-	2.44	-	
		PLS[2:0] = 100	-	2.54	-	
		PLS[2:0] = 101	-	2.64	-	
		PLS[2:0] = 110	-	2.74	-	
		PLS[2:0] = 111	-	2.84	-	

5.2.3 Supply current characteristics

Table 5.7: Supply current characteristics

Mode	Conditions	VDD@25°C			Unit
		2.0V	2.5V	3.6V	
Run Mode ¹	HCLK= 72 MHz,Execute from Flash,APB clock enable	12.43	12.92	12.3	mA
	HCLK= 72 MHz,Execute from Flash,APB clock disable	8.0	8.22	7.73	mA
	HCLK=48MHz(FHSI),Execute from Flash,APB clock enable	9.83	9.55	10.04	mA
	HCLK=48MHz(FHSI),Execute from Flash,APB clock disable	6.96	6.41	6.89	mA
	HCLK=8MHz(HSE),Execute from Flash,APB clock enable	3.35	2.78	3.41	mA
	HCLK=8MHz(HSE),Execute from Flash,APB clock disable	2.84	2.37	2.87	mA
	HCLK=8MHz(MHSI),Execute from Flash,APB clock enable	3.11	2.54	2.79	mA
	HCLK=8MHz(MHSI),Execute from Flash,APB clock disable	2.54	1.91	2.28	mA
Sleep Mode	HCLK= 72 MHz, APB clock disable	3.23	2.79	3.04	mA
	HCLK=8MHz(MHSI), APB clock disable	1.68	0.93	1.12	mA
Stop Mode	LDO normal mode,HSE/HSI/LSE OFF	240	264	296	uA
	LDO Low power mode,HSE/HSI/LSE OFF	15.98	17.34	20.8	uA
Standby Mode	LSI and IWDG running	4.29	4.52	5.14	uA
VBAT Mode	RTC and LSE running	0.78	1.05	1.25	uA

Note1: Cache is enabled.

Note2: Internal voltage pump is turned on when VDD lower than 2.5V.

Note3: Add an additional power consumption of 0.8 mA in 12-bit mode ADC for the analog part.

5.2.4 External clock source characteristics

Table 5.8: High-speed external user clock characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSE_{ext}}$	User external clock source frequency	-	-	8	16	MHz
V_{HSEH}	OSC_IN input pin high level voltage		0.7VDD	-	VDD	V
V_{HSEL}	OSC_IN input pin low level voltage		VSS	-	0.3VDD	
$T_{W(HSE)}$	OSC_IN high or low time		16	-	-	ns
$T_{r(HSE)}$	OSC_IN rise or fall time		-	-	5	
$T_{f(HSE)}$						
$C_{in(HSE)}$	OSC_IN input capacitance		-	-	5	-
$DuCy_{(HSE)}$	Duty cycle	-	45	-	55	%

Note1:Based on simulation and avt test results, not tested in production.

Table 5.9: Low-speed external user clock characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSE_{ext}}$	User external clock source frequency	-	-	32.768	-	KHz
V_{LSEH}	OSC_IN input pin high level voltage		0.7VDD	-	VDD	V
V_{LSEL}	OSC_IN input pin low level voltage		VSS	-	0.3VDD	
$T_{W(LSE)}$	OSC_IN high or low time		450	-	-	ns
$T_{r(LSE)}$	OSC_IN rise or fall time		-	-	50	
$T_{f(LSE)}$						
$C_{in(LSE)}$	OSC_IN input capacitance	-	-	5	-	pF
$DuCy_{(LSE)}$	Duty cycle	-	30	-	70	%
$T_{SU(LSE)}$	startup time	VDD is stabilized	-	2	-	s

Note 1: Based on simulation and avt test results, not tested in production.

5.2.5 Internal clock source characteristics

Table 5.10: High-speed internal (MHSI) RC oscillator

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{MHSI}	Frequency	-	-	8	-	MHz
$DuCy_{(MHSI)}$	Duty cycle	-	45	-	55	%
$ACC_{(MHSI)}$	Accuracy of the MHSI oscillator	$T_A = -40$ to 85°C	TBD	-	TBD	%
		$T_A = 0$ to 85°C	TBD	-	TBD	%
		$T_A = 25^{\circ}\text{C}$	TBD	-	TBD	%
$T_{SU(MHSI)}$	MHSI oscillator startup time	$VSS \leq V_{in} \leq VDD$	1	-	2	us
$I_{DD(MHSI)}$	MHSI oscillator power consumption	-	-	25	-	uA

Table 5.11: High-speed internal (FHSI) RC oscillator

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{FHSI}	Frequency	-	-	48	-	MHz
$DuCy_{(FHSI)}$	Duty cycle	-	45	-	55	%
$ACC_{(FHSI)}$	Accuracy of the FHSI oscillator	$T_A = -40$ to 85°C	TBD	-	TBD	%
		$T_A = 0$ to 85°C	TBD	-	TBD	%
		$T_A = 25^\circ\text{C}$	TBD	-	TBD	%
$T_{SU(FHSI)}$	FHSI oscillator startup time	$V_{SS} \leq V_{in} \leq V_{DD}$	200	-	500	ns
$I_{DD(FHSI)}$	FHSI oscillator power consumption	-	-	55	-	μA

Table 5.12: Low-speed internal (LSI) RC oscillator

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{LSI}	Frequency	-	20	-	40	KHz
$T_{SU(LSI)}$	LSI oscillator startup time	-	-	-	85	μs
$I_{DD(LSI)}$	LSI oscillator power consumption	-	-	250	-	nA

5.2.6 PLL characteristics

Table 5.13: PLL characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{PLLIN}	PLL input clock	-	1	8	16	MHz
	PLL input clock duty cycle	-	40	-	60	%
f_{PLLOUT}	PLL multiplier output clock	-	-	72	-	MHz
T_{LOCK}	PLL lock time	-	-	-	200	μs
Jitter	Cycle-to-cycle jitter	-	-	-	300	ps

Note1: Based on simulation and avt test results, not tested in production.

5.2.7 Memory characteristics

Table 5.14: Flash memory characteristics

Symbol	Parameter	Min	Typ	Max	Unit
T_{PROG}	Page program time	-	2.1	-	ms
T_{ERASE}	Page erase time	-	6.4	-	ms
	Mass erase time	-	25.6	-	ms
IDD_{PROG}	Page program current	-	-	2	mA
IDD_{ERASE}	Page erase current	-	-	1.5	mA
IDD_{READ}	Read current@48MHz	-	-	4.7	mA
	Read current@24MHz	-	-	2.5	mA
N_{END}	Endurance	100	-	-	kcycles
t_{RET}	Data retention	10	-	-	year

5.2.8 Absolute maximum ratings (electrical sensitivity)

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size is either 3 parts (cumulative mode) or 3 parts \times (n + 1) supply pins (non-cumulative mode). The human body model (HBM) can be simulated. The tests are compliant with JESD22-A114/C101 standard.

Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin
- A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with ANSI/ESDA/JEDEC IC latch-up standard.

Table 5.15: ESD absolute maximum ratings

Symbol	Parameter	Condition	Maximum value	Unit
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	$T_A = +25\text{ }^\circ\text{C}$, compliant with JEDEC JS-001-2017	4000	V
$V_{ESD(CDM)}$	Electrostatic discharge voltage (charge device model)	$T_A = +25\text{ }^\circ\text{C}$, compliant with JEDEC JS-002-2018	500	V
I_{LU}	Static latch-up class	$T_A = +25\text{ }^\circ\text{C}$, compliant with JEDEC 2016	200	mA

5.2.9 EFT Characteristics

Table 5.16: EFT Characteristics

Symbol	Standard	Voltage	Class
EFT to IO	(IEC61000-4-4)	2KV	Class□4
EFT to Power	(IEC61000-4-4)	4KV	Class□4

Software suggestion

Software flow must contain code to prevent CPU run away, for example□

- Crashed Program Counter.
- Unpredicted Reset
- Crashed important data in control register

Increase driven strength of IOs improve the capability of EFT

5.2.10 IO characteristics

Table 5.17: IO static characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IH}	Input high level voltage	-	0.65VDD	-	VDD+0.5	V
V_{IL}	Input low level voltage	-	-0.5	-	0.3VDD	V
V_{hys}	Schmitt trigger voltage hysteresis	-	5%VDD	-	-	V
I_{lkg}	Input leakage current	$V_{SS} \leq V_{in} \leq V_{DD}$	-	-	± 1	μA
R_{pu}	Weak pull-up equivalent resistor	$V_{in}=V_{SS}$	30	40	50	$k\Omega$
R_{pd}	Weak pull-down equivalent resistor	$V_{in}=V_{DD}$	30	40	50	$k\Omega$
C_{IO}	I/O pin capacitance	-	-	5	-	pF

Table 5.18: Input/output AC characteristics

Speed	Parameter	Conditions	Min	Typ	Max	Unit
x0	$f_{max(IO)out}$	Maximum frequency	$C_L=50pF, V_{DD}=2V$ to 3.6V	-	10	MHz
	$t_{f(IO)out}$	Output high to low level fall time		-	125	ns
	$t_{r(IO)out}$	Output low to high level rise time		-	125	ns
x1	$f_{max(IO)out}$	Maximum frequency	$C_L=50pF, V_{DD}=2V$ to 3.6V	-	50	MHz
	$t_{f(IO)out}$	Output high to low level fall time		-	25	ns
	$t_{r(IO)out}$	Output low to high level rise time		-	25	ns

5.2.11 TIM characteristics

Table 5.19: TIM characteristics

Symbol	Conditions	Min	Max	Unit
$T_{res(TIM)}$	Timer resolution time	1	-	$T_{TIMxCLK}$
FEXT	Timer external clock frequency on CH1 to CH4	0	$T_{TIMxCLK}/2$	MHz
RESTIM	Timer resolution	-	20	bit
$T_{counter}$	16-bit counter clock period when internal clock is selected	1	65536	$T_{TIMxCLK}$
T_{MAX_COUNT}	Maximum possible count	1	1048576×65536	$T_{TIMxCLK}$

Note1: $T_{TIMxCLK} = 72 \text{ MHz}$

5.2.12 USB DC electrical characteristics

Table 5.20: USB DC electrical characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
VDD	USB operating voltage		3.0	3.6	V
V_{DI}	Differential input sensitivity	I(USBDP, USBDM)	0.2		V
V_{CM}	Differential common mode range	Includes V_{DI} range	0.8	2.5	V
V_{SE}	Single ended receiver threshold		1.3	2.0	V
V_{OL}	Static output level low	R_L of 1.5 kom to 3.6 V		0.3	V
V_{OH}	Static output level low	R_L of 15 kom to VSS V	2.8	3.6	V

Note1: To be compliant with the USB 2.0 full-speed electrical specification, the USBDP (D+) pin should be pulled up with a 1.5 kom resistor to a 3.0-to-3.6 V voltage range.

Note2: Based on simulation and avt test results, not tested in production.

Note3: R_L is the load connected on the USB drivers.

Figure 5.1: USB timings: definition of data signal rise and fall time

Table 5.21: USB Full-speed electrical characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
t_r	Rise time	$C_L = 50 \text{ pF}$	4	20	ns
t_f	Fall time	$C_L = 50 \text{ pF}$	4	20	ns
t_{rfm}	Rise/fall time matching	t_r/t_f	90	110	%
V_{CRS}	Output signal crossover voltage		1.3	2.0	V

Note 1: Based on simulation and avt test results, not tested in production.

5.2.13 CMP characteristics

Table 5.22: CMP characteristics

Symbol	Parameter	Min	Typ	Max	Unit
V_{in}	Input voltage	0.6	-	VDD-0.3	V
V_{HYST}	Hysteresis	-	2	5	mV
V_{OFF}	Input Offset voltage	-	5	15	mV
$TPGD$	Propagation Delay	-	-	200	nS
I_q	Operation Current	-	-	8.5	uA

5.2.14 ADC characteristics

Table 5.23: ADC characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
VDDA	Power supply	-	2.4	-	3.6	V
f_s	Sampling rate	-	0.05	-	1	MHz
f_{TRIG}	External trigger frequency	$f_{ADC} = 14 \text{ MHz}$	-	-	823	KHz
V_{AIN}	Conversion voltage range	-	0	-	VDDA	V
R_{AIN}	External input impedance	-	-	-	200	Ω
C_{AIN}	External capacitor	-	-	TBD	-	pF
I_{lkg}	Injection current on Analog input	-	-	-	10	uA
R_{ADC}	Sampling switch resistance	-	-	-	1.4	k Ω
C_{ADC}	Internal sample and hold capacitor/12-bit	-	-	15.5	-	pF

Table 5.24: ADC Conversion time

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
T_{AD}	ADC clock frequency	-	62.5	-	-	ns
T_{CONV}	Conversion time	12-bit	-	$13T_{AD}$	-	ns
F_{CONV}	Sampling rate	12-bit	-	-	940	KSPS
T_{SAMP}	Sampling time	12-bit	$3T_{AD}$	-	-	ns
t_{DIS}	Dis-charge time	-	-	$0.5T_{AD}$	-	ns
t_{DPU}	Power-up time	-	-	-	20	us

Chapter 8

Ordering information

Figure 8.1: Ordering information

WB32F 103 R B T 6 -7

Device family

ARM-based 32-bit microcontroller

Device subfamily

- 101 = WB32F101xx
- 102 = WB32F102xx
- 103 = WB32F103xx
- 104 = WB32F104xx
- 105 = WB32F105xx

Pin count

- K = 32 pins
- T = 36 pins
- C = 48 pins
- R = 64 pins

Flash memory size

- 6 = 32 KB Flash
- 8 = 64 KB Flash
- 9 = 96 KB Flash
- B = 128 KB Flash
- A = 192 KB Flash
- C = 256 KB Flash

Package

- T = LQFP
- U = QFN

Temperature range

6 = Industrial temperature range, -40°C~85°C

Package details

- 7 = LQFP64 -7 x 7 mm
- None = Other package
